“Exploring the Power of Machine Learning with IBM Cloud”

Project Title – Loan Approval Prediction using Machine Learning with IBM watsonx.ai AutoAI

Domain of Project – Banking & Finance

Student Name	Recent Passport Photo	Email ID	Mobile number [WhatsApp]
Rahul Karunya Garige		rahulkarunyagarige@gmail.com	9347959157

Problem Statement: Loan Approval Prediction using Machine Learning

Financial institutions receive a large number of loan applications every day from individuals with diverse financial and personal backgrounds. Evaluating each application manually is a time-consuming and error-prone process that may lead to inconsistent decisions, delayed approvals, and increased operational costs. Incorrect loan approval decisions can result in financial losses for banks, while rejecting eligible applicants may reduce customer satisfaction. The objective of this project is to design, build, and evaluate a **binary classification model** that accurately predicts whether a loan application should be **approved or rejected** based on applicant information such as gender, marital status, education, employment status, income, loan amount, loan term, credit history, and property area. The goal is to develop a reliable machine learning solution using **IBM watsonx.ai AutoAI** that assists financial institutions in making faster, more accurate, consistent, and data-driven loan approval decisions.

Proposed Solution: (IBM watsonx.ai Studio – AutoAI)

I propose an **AI-powered Loan Approval Prediction System** using **IBM watsonx.ai Studio** and **AutoAI**. Applicant information such as **gender, marital status, education, employment status, applicant income, co-applicant income, loan amount, loan amount term, credit history, and property area** is uploaded to **watsonx.ai**. **AutoAI** automatically performs **data preprocessing, dataset splitting, feature engineering, algorithm selection, hyperparameter optimization, and ensemble creation** to generate and evaluate multiple machine learning pipelines. The generated pipelines are ranked based on **cross-validation accuracy**, and the **best-performing model** is automatically selected for deployment. The selected model predicts whether a loan application will be **Approved (Y)** or **Rejected (N)**, enabling financial institutions to make **faster, more accurate, consistent, and data-driven lending decisions**.

Technology Used

- **IBM Cloud** – Provides a secure, reliable, and scalable cloud platform for developing, training, and deploying machine learning solutions.
- **IBM watsonx.ai Studio (AutoAI)** – Used to automate the machine learning workflow, including data preprocessing, feature engineering, model selection, hyperparameter optimization, and pipeline generation.
- **Programming Language:** Python (Auto-generated notebook from IBM watsonx.ai)
- **Dataset:** Loan Approval Prediction Dataset
- **ML Algorithm / Model Used:** Batched Tree Ensemble Classifier (Snap Random Forest Classifier)
- **Machine Learning Task:** Binary Classification
- **Prediction Column:** Loan_Status
- **Accuracy Obtained:** 81.0% (Cross-validation Accuracy)
- **Enhancements & Hyperparameter Tuning:** Feature Engineering (FE), Hyperparameter Optimization (HPO-1 & HPO-2), Batch Ensemble Creation

4 Selection of Prediction Parameters and Setting Experiment Settings

The screenshot displays the IBM Cloud Pak for Data interface for configuring an AutoAI experiment. The top navigation bar includes the IBM Cloud Pak for Data logo, a search bar, an upgrade button, a help icon, a notification bell with a red '1', the user's name 'Rahul Karunya Garige's Acc...', a dropdown menu, the location 'Frankfurt', and a user profile icon 'RG'.

The breadcrumb trail shows the path: [Projects](#) / [Loans Application](#) / Loans Application. The main title is 'Configure AutoAI experiment Loans Application', with an edit icon and an 'Autosaved: 15:44:51' timestamp.

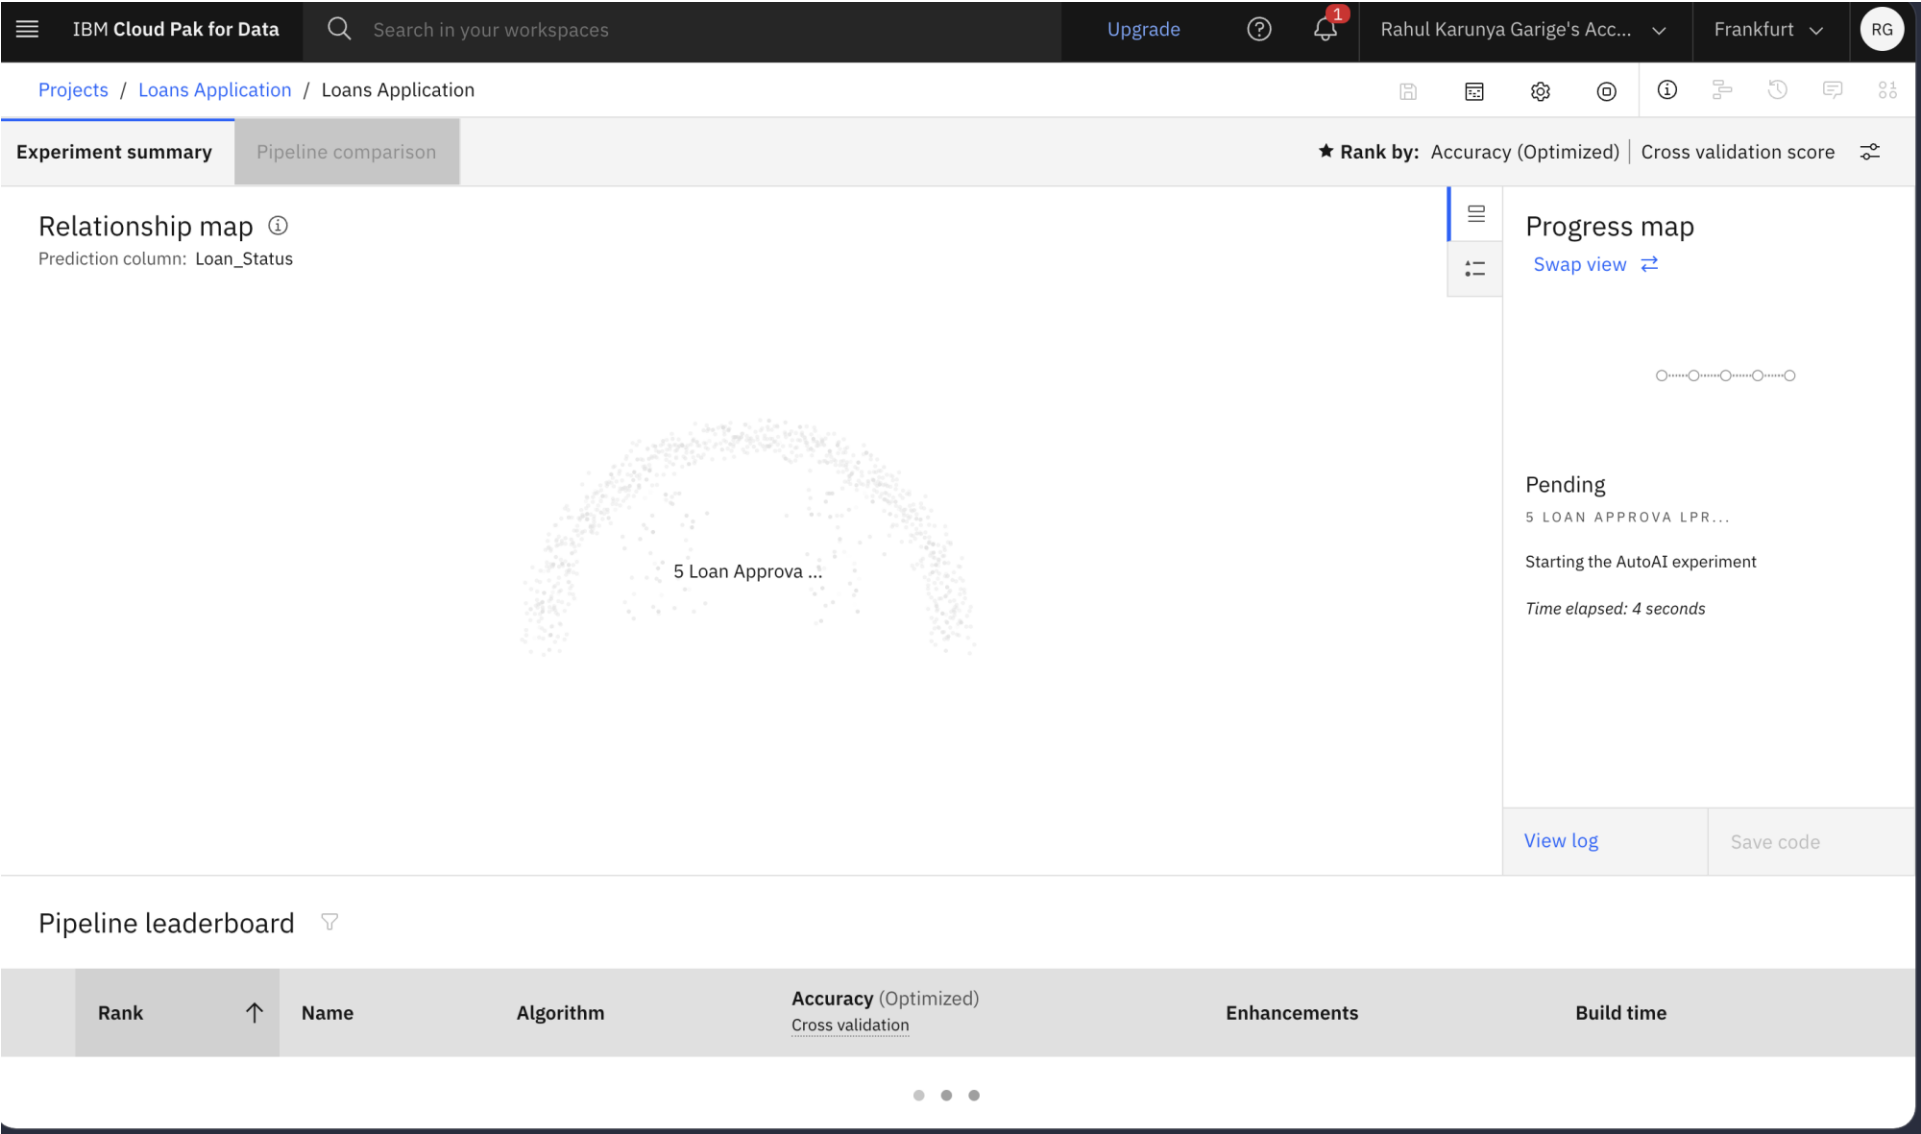

The interface is divided into two main panels:

- Add data source:** This panel contains a dashed box with the text 'Add files such as tabular data (CSV)'. Below this are two buttons: 'Browse' and 'Select from project'. A file named '5 Loan Approva lPrediction.csv' is listed with a size of 36.26 KB and 13 columns.
- Configure details:** This panel contains several configuration options:
 - Create a time series analysis?** A toggle switch with 'Yes' and 'No' options. The 'No' option is selected.
 - What do you want to predict?** A dropdown menu with 'Loan_Status' selected.
 - Prediction column:** A text field displaying 'Loan_Status'.
 - CUH remaining:** A status indicator showing '17.48 CUH'.
 - Prediction Type:** A section titled 'PREDICTION TYPE' showing 'Binary Classification'.
 - Positive Class:** A label 'POSITIVE CLASS Y'.
 - Optimized for:** A label 'OPTIMIZED FOR Accuracy & run time'.

The bottom of the interface features a dark bar with 'Experiment settings' and a gear icon, and a blue bar with 'Run experiment' and a play button icon.

18 Creating Deployment Space

The screenshot shows the IBM Cloud Pak for Data interface. The top navigation bar includes the IBM Cloud Pak for Data logo, a search bar, an 'Upgrade' button, a help icon, a notification bell with a red '1', the user's name 'Rahul Karunya Garige's Ac...', the location 'Frankfurt', and a profile icon 'RG'. The breadcrumb trail is 'Projects / Loans Application / P5 - Snap Random Forest Classifier: Loans Application'. The main content area is titled 'Promote to space' with a subtitle 'Promote the asset to a deployment space to deploy the asset or to support a deployment'. A modal dialog box titled 'Create a deployment space' is open, with a subtitle 'Use a space to collect assets in one place to create, run, and manage deployments'. The dialog has two tabs: '+ New' (selected) and 'Local file'. The 'Define details' section contains a 'Name' field with the value 'Project', a 'Description (Optional)' field with the placeholder text 'What's the purpose of this space?' and a character count '0/100', and a 'Deployment stage' dropdown menu with the text 'Select or enter a name that describes the purpose of the space'. At the bottom of the dialog are 'Cancel' and 'Create' buttons.

20 Promote to Space Successful

The screenshot displays the IBM Cloud Pak for Data interface. At the top, the navigation bar includes the IBM Cloud Pak for Data logo, a search bar, an 'Upgrade' button, a help icon, a notification bell with a red '1', the user's name 'Rahul Karunya Garige's Ac...', the location 'Frankfurt', and a profile icon 'RG'.

The main content area shows the breadcrumb 'Projects / Loans Application / P5 - Snap Random Forest Classifier: Loans Application'. A modal window titled 'Promote to space' is open, containing the instruction 'Promote the asset to a deployment space to deploy the asset or to support a deployment.' Below this, a green checkmark and the text 'Promotion completed.' are visible.

A table titled 'Selected assets (1)' lists the promoted asset:

Name	Format	Version	Status
P5 - Snap Random Forest Classifier: Loans Ap...	Model	Current	Promoted ✓

Below the table, a note states: 'Promoting an asset promotes dependent assets as well. For example, promoting a model also promotes the associated software specification and package extensions. You will see all promoted assets in the target space.'

A green success notification box in the top right corner of the modal reads: 'Success Successfully promoted P5 - Snap Random Forest Classifier: Loans Application to the deployment space. Go to the deployment space to prepare the assets for deployment. Timestamp 3:52:08 PM'.

A blue 'Close' button is located at the bottom right of the modal.

API keys

Create, view, and work with API keys that you have access to manage. IBM Cloud API keys are associated with a user's identity and can be used to access cloud platform and classic infrastructure APIs, depending on the access that is assigned to the user. The following table displays a list of API keys created in this account. [Learn more](#).

Looking for more options to manage API Keys? Try [IBM Cloud® Secrets Manager](#) for creating and leasing API keys dynamically and storing them securely in your own dedicated instance.

Unused or overly permissive API keys increase the risk of unauthorized access. Regularly review the [Inactive identities report](#), rotate keys, and apply only the minimum required permissions.

API keys associated with a user's identity have the same access that the user is assigned across all accounts. To update the access for an API key, assign or remove access for the user.

 **Project Overview**

Loan Approval Prediction System is an end-to-end machine learning web application that uses an IBM watsonx.ai AutoAI model to predict whether a loan application will be **Approved** or **Rejected** based on 11 applicant features.

The model was trained on a real-world loan dataset and deployed as an Online Deployment on IBM Cloud (eu-de region). A Flask backend handles IAM authentication, input validation, and REST API communication — ensuring your credentials are never exposed to the browser.

IBM watsonx.ai AutoAI

Region:

eu-de (Frankfurt)

Deployment:

Online (REST API)

 **Model Input Features**

 **Loan_ID**
Auto-generated unique ID (LP + timestamp). Not entered by user.

 **Gender**
Male / Female

 **Married**
Yes / No

 **Dependents**
0 / 1 / 2 / 3+

 **Education**
Graduate / Not Graduate

 **Self_Employed**
Yes / No

 **ApplicantIncome**
Monthly income of the primary applicant

 **CoapplicantIncome**
Monthly income of the co-applicant (0 if none)

 **LoanAmount**
Requested loan amount in thousands

 LoanAI

[Home](#) [Predict](#) [About](#) [Get Prediction](#)

 **IBM Cloud & watsonx.ai**

IBM Cloud is a full-stack cloud platform with over 170 products and services. IBM watsonx.ai is the AI studio within IBM Cloud that provides tools to train, validate, tune, and deploy AI models with full governance.

The deployment endpoint used by this app is hosted in the **eu-de (Frankfurt)** region:

`eu-de.ml.cloud.ibm.com/ml/v4/deployments/.../predictions`

Authentication uses IBM IAM (Identity and Access Management) — the Flask backend exchanges your API key for a short-lived Bearer token automatically.

 **AutoAI Workflow**

- Data Ingestion** — Upload the CSV dataset to IBM watsonx.ai project.
- AutoAI Experiment** — Configure the target column (Loan_Status) and run.
- Pipeline Comparison** — AutoAI tries multiple algorithms (Random Forest, XGBoost, etc.) and hyper-parameter combinations.
- Best Pipeline** — The highest-ranked pipeline is saved as a model.
- Online Deployment** — Model is deployed as a REST endpoint.
- API Call** — This Flask app calls the endpoint with a JSON payload and receives `prediction + probability`.

 **API Integration Flow**

 **Step 1 — IAM Token**

Flask POSTs the `IBM_API_KEY` to `iam.cloud.ibm.com/identity/token` to obtain a Bearer token. Token is cached for ~1 hour.

 **Step 2 — Payload Build**

Form data is validated, numeric fields are cast, and Loan_ID is auto-generated. A structured JSON payload is assembled matching the model's expected schema.

 **Step 3 — Scoring Request**

Flask POSTs the payload to the IBM watsonx.ai deployment endpoint with the Bearer token in the Authorization header.

 **Step 4 — Parse & Display**

The response `prediction` (Y/N) and `probability` array are parsed. The result is stored in the Flask session and rendered on the result page.

Dependents	0	Loan Amount	30000K
Education	Not Graduate	Loan Term	120 months
Self Employed	Yes	★ Credit History	Good (1)
		Property Area	Rural

Novelty and Uniqueness

- The solution automates the **loan approval prediction process**, reducing manual evaluation effort and improving decision-making efficiency.
- It uses **IBM watsonx.ai AutoAI** to automatically perform **data preprocessing, feature engineering, algorithm selection, and hyperparameter optimization** with minimal coding.
- The system evaluates **multiple machine learning pipelines** and automatically selects the **best-performing model** based on cross-validation accuracy.
- Automated feature engineering identifies hidden patterns and relationships among applicant attributes, improving prediction performance.
- The model provides **fast, consistent, and data-driven loan approval predictions**, helping financial institutions reduce human bias and improve operational efficiency.

Git Hub Link

- Git Hub Repo: <https://github.com/garigerahulkarunya-git/loan-approval-webapp.git>

Future Scope

- The solution can be integrated with **banking systems** to automate the end-to-end loan application screening and approval process.
- Additional applicant information, such as **credit scores, banking transactions, employment history, and financial records**, can be incorporated to improve prediction accuracy.
- Real-time integration with **credit bureaus and financial databases** can enhance applicant verification and fraud detection.
- Advanced AI models in **IBM watsonx.ai** can be used to continuously retrain and improve prediction performance as new loan data becomes available.
- The solution can be extended to **predict loan default risk, recommend suitable loan products, and provide explainable AI insights** to support transparent and data-driven lending decisions.

Certificates Earned: Exploring Quantum Computing

IBM **SkillsBuild**

Completion Certificate

This certificate is presented to
Rahul Karunya Garige

for the completion of
Exploring Quantum Computing
(ALM-COURSE_3825253)

According to the Adobe Learning Manager system of record

Completion date: 29 Jun 2026 (GMT)

Learning hours: 50 mins

Certificates Earned: Getting Started with Artificial Intelligence

In recognition of the commitment to achieve
professional excellence

Rahul Karunya Garige

Has successfully satisfied the requirements for:

Getting Started with Artificial Intelligence

Issued on: Jun 23, 2026
Issued by: IBM SkillsBuild

Verify: <https://www.credly.com/badges/911f48aa-e19f-4ad5-9046-e52bfce0d018>

Certificates Earned: Getting Started with Cybersecurity

In recognition of the commitment to achieve
professional excellence
